1 Bias Analysis

This notebook analyzes the results from the bias experiment, specifically looking at the average preference for stereotypical over anti-stereotypical completions when both logits are not negative infinity.

[102]:
```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
from tabulate import tabulate
import seaborn as sns
```

[103]:
```
# Load the data
df = pd.read_csv('../results/caste_results.csv')

# Display basic information about the dataset
print(f"Total number of examples: {len(df)}")
print(f"Number of examples where both_neg_inf=0: {sum(df['both_neg_inf'] ==␣
↪0)}")
print(f"Number of examples where both_neg_inf=1: {sum(df['both_neg_inf'] ==␣
↪1)}")
```

```
Total number of examples: 105
Number of examples where both_neg_inf=0: 102
Number of examples where both_neg_inf=1: 3
```

[104]:
```
# Filter for cases where both_neg_inf=0
valid_cases = df[df['both_neg_inf'] == 0]

# Calculate the average preference for stereotypical over anti-stereotypical
avg_preference = valid_cases['prefer_stereo_over_anti_stereo'].mean()
print(f"Average preference for stereotypical over anti-stereotypical when␣
↪both_neg_inf=0 (among opinionated): {avg_preference:.3f}")

# Calculate the percentage of cases preferring stereotypical
percent_prefer_stereo = valid_cases['prefer_stereo_over_anti_stereo'].mean() *␣
↪100
print(f"Percentage: {percent_prefer_stereo:.1f}%")
```

```
Average preference for stereotypical over anti-stereotypical when both_neg_inf=0
(among opinionated): 0.775
Percentage: 77.5%
```

[105]:
```python
# Analyze by target groups
# desire: Preference Rate (Among Opinionated), Opinionated Count, No Opinion Rate, Total Count
df1 = df.groupby("Target_Stereotypical")["both_neg_inf"].agg(["mean", "count"])
df1.columns = ["No Opinion Rate", "Total Count"]
df1["No Opinion Rate"] = df1["No Opinion Rate"] * 100

df2 = valid_cases.groupby("Target_Stereotypical")["prefer_stereo_over_anti_stereo"].agg(
    ["mean", "count"]
)
df2.columns = ["Preference Rate (Among Opinionated)", "Opinionated Count"]
df2["Preference Rate (Among Opinionated)"] = (
    df2["Preference Rate (Among Opinionated)"] * 100
)

df2 = df2.join(df1, on="Target_Stereotypical")
df2["Negative Bias + No Opinion Rate"] = (
    df2["Opinionated Count"]
    * (100 - df2["Preference Rate (Among Opinionated)"])
    / 100
    / df2["Total Count"] * 100
    + df2["No Opinion Rate"]
)

print("\nPreference analysis by target group:")
print(df2)
```

```
Preference analysis by target group:
                     Preference Rate (Among Opinionated)  Opinionated Count  \
Target_Stereotypical
Brahmin                                            72.58                 62
Brahmins                                          100.00                  2
Dalit                                              83.33                 36
